

An apparatus for preparing dialysis liquid which includes a container holder 112 for holding a container 102 in the inverted state, the container having a tubular body portion which defines an internal volume for accommodating powder preparation for preparing dialysis liquid, a bottom wall defined at an end of the tubular body portion, and a sealing member for closing an outlet opening defined at the end of the tubular body portion opposite to the bottom wall, a cutter 118, movable toward and away from the sealing member, for cutting the sealing member, a concentrated liquid tank 114a provided under the container holder 112, a mesh member 116, horizontally disposed above the tank, for receiving the powder preparation which has fallen from the container 102, a nozzle 120 for applying water to the powder preparation, for preparing dialysis liquid, which has fallen on the mesh member from the container after the sealing member is cut by the cutter 118. The water is applied to the powder preparation for preparing dialysis liquid dropped on the mesh member to produce a concentrated liquid for the dialysis liquid, which is received in the concentrated liquid tank 114a, and the concentrated liquid is diluted with a diluting water as it supplied to the dialyzer 160.
